

## Week 7

What are 3 HTML elements not mentioned any of the video this week? What do they do and how are they used?

- `<base>` - The `<base>` HTML element specifies the base URL to use for all relative URLs in a document. There can be only one `<base>` element in a document.
- `<header>` - The `<header>` HTML element represents introductory content, typically a group of introductory or navigational aids. It may contain some heading elements but also a logo, a search form, an author name, and other elements.
- `<footer>` - The `<footer>` HTML element represents a footer for its nearest ancestor sectioning content or sectioning root element. A `<footer>` typically contains information about the author of the section, copyright data or links to related documents.

Choose one of your favorite websites and identify 5 different HTML elements used on the website. Make sure to include the URL in your submission.

Google.com –

`<head>`

`<body>`

`<style>`

`<div>`

`<script>`

What is your favorite thing you learned this week?

- This week my favorite thing I learned was the difference between elements you can use within the HTML along with the different functions they hold such as `<button>` `<list>``<table>` etc. You can do so much w/in the HTML page, the possibilities are endless.
